| Supervisory Patent Examiner, Art Unit 2435  |   |  |   |

Continuation of 11. does NOT place the application in condition for allowance because: Applicant's arguments, regarding to claim rejections, filed Feb. 12, 2010 have been fully considered by they are not persuasive.

Regarding to applicant's argument to claims 1, 7, 10, 29, Examiner maintains since Krancher's invention relates to notebook computers and related docking stations. As shown in Fig. 1, the notebook includes a docking connector 82 coupled to the bus pins of a secondary expansion bus. The connector 82 and the PCI bus 70 that the notebook computer communicates with devices in the docking station. The quick switch is connected to the docking connector, which is controlled by the software executed in the notebook computer as shown in Fig. 3, 4. Further, Seeker's invention relates to a secure computer with a bus monitor. The bus access monitor monitors data communicated from trusted bus and detect the address information associated with a datum. Therefore, Seeker provides the security protection for communication via a bus for a computer using the bus access monitor logic. Further, Lee teaches transmitting the authentication transmission in a format as shown in Figs. 3, 4. The format includes the authenticated command bit, the information/command bits. Furthermore, the examiner recognizes that obviousness can also be established by combining or modifying the teaching of the prior art to produce the claimed invention where there is some teaching, suggestion, or motivation to do so found either in the references themselves or in the knowledge generally available to on of ordinary skill in the art. See In re Fine, 837 F. 2d 1071, 5 USPQ2d 1596 (Fed. Cir. 1988) and In re Jones, 958 F.2d 347, 21 USPQ 2nd 1941 (Fed. Cir 1992). In this case the combination of Krancher, Seeker and Lee teaches "a bus coupled to the chipset to communicate a trusted data cycle to the internal component of the computer system, a secure docking circuit (monitor) to detect the trusted data cycle by detecting a predefined trusted data cycle indicator value (authenticated information/command bits, as disclosed by Lee), prevent the trusted data cycle from being provided to a device external to the computer system (as disclosed by Seeker) through the docking connector (as disclosed by Krancher). Further, the Supreme Court emphasized that "the principles laid down in Graham reaffirmed the 'functional approach' of Hotchkiss, 11 How. 248." KSR, 127 S. Ct. at 1739 (citing Graham v. John Deere Co., 383 U.S. at 12 (emphasis added)), and reaffirmed principles based on its precedent that "[t]he combination of familiar elements according to known methods is likely to be obvious when it does no more than yield predictable results." Id. Therefore, the combination of Krancher and Seeker teaches the claim subject matter and the combination is sufficient.

Based on the reason above the cited prior art teaches the claim limitation, however, if the applicant believes that the pending claims are distinct from the cited prior art, the applicant needs to further modify the claim limitation/language to clarify the claim subject matter for further consideration and distinction from the prior art.
